D1	REPORT has no requirement	Mostly resolved by FR item 12. Leftover: FR item 7's command list still leaves out REPORT.	Yes good observation item 7 FR should have Report as well.
D2	An off-table PLACE is not covered		Part 1 so if the Robot is originally Placed at 4,2,NORTH and then another Place command is issue say PLACE (for example 9,9,NORTH) then the Robot will remain at Placed at 4,2,NORTH i.e. we will not move the Robot and will show message to the user with reason for not moving. Part 2 If very first request to Place the Robot is PLACE (for example 9,9,NORTH) the robot will still remain unplaced and and we inform the user the reasoning. I am not suggesting to have a default in this case as the original requirement document does mention about default placement of the Robot in this case.
D3	Any command" ignored, including PLACE		
D4	Keep going after a blocked move		If you asking say original command was PLACE 1,0, East and the second line was move and then PLACE again but the bad one PLACE 1,2 and then another PLACE 3,2,North then what should happen when runner encounter the bad line? My answer is we should ignore the bad line and process the next Plane i.e PLACE 3,2,North.
D5	Coordinate range (0..4) and origin not stated		we will use 0..4 and I am also suggesting add the table size configuration based so by default it will be 5*% but can be change based on the configuration provided which will be feature flagged
D6	Test data, development process write-up and AI artefacts missing		your assumptions is correct
D7	PLACE X Y F and N/S/E/W instead of PLACE X,Y,F and the full words		your assumptions is correct

D8	Command line" instead of "standard input		your assumptions is correct
J1	coordinate range (0..4 or 0..5)		we will use 0..4 and I am also suggesting add the table size configuration based so by default it will be 5*% but can be change based on the configuration provided which will be feature flagged
J4	input source (standard input, file, both or arguments)		stdin
J7	J7: REPORT format (exact X,Y,F or richer)		Report format should be richer so that it will make sense to a person who is reading the report
J8	J8: how interactive input ends (end of input, EXIT, or both)		both - make sure it work for any OS
J9	J9: one command per line or several		one per line
J11	J11: robot state that changes in place or is replaced		Replaced - if we change the current state of the robot that if the state is invalid we will need to remember to switch back to valid state and it can be error prone and so if we create a copy of the next state and first check if the next state is valid and if valid only then we will replace current state with the new state, this is much cleaner and error proof
J5	J5 (rest): extra spaces, N/S/E/W shortcuts and the		trim extra space , support lower and upper case and I use N/S/E/W and now full word just as a shortcut. We could add a support for abbrevation but I would leave it for now as not asked in the original document
